

DESCRIPTION

DEVICE AND METHOD FOR COMMUNICATION WITH HOUSEKEEPING SERVICES

Background of the Invention

Field of the Invention

[001] The present invention relates to a device for communicating a hotel guest's cleaning instructions to hotel housekeeping services, and method for such.

Description of the Related Art

[002] In the hotel industry, occupied hotel rooms are typically cleaned on a daily basis. This daily cleaning often includes the replacing of bedding and bath towels. As a result, individual hotels daily generate large quantities of laundry, which require vast amounts of electricity, detergent, and water.

[003] Accordingly, many hotels have instituted policies permitting the hotel guest to decide whether or not to have the bedding and towels replaced daily. In order for the hotel guests to communicate instructions to housekeeping services, hotels have provided various communication means in the hotel rooms. Typically, to communicate instructions, a hotel guest will hang a sign on the door handle, which will instruct housekeeping services on whether or not to replace the bedding and towels. Alternatively, some hotels have instructional cards in the rooms, which the guest completes and leaves on the dresser.

[004] Unfortunately, many times these signs and instructional cards are often lost and/or not replaced, or are not seen and used by the hotel guests. Additionally, they may also go unnoticed by housekeeping services, even when used properly. As a result, housekeeping services often unnecessarily replace a room's bedding and towels.

[005] Accordingly, there remains a need in the hotel industry for a simple, reliable communication means, which can communicate various instructions to housekeeping services.

Brief Summary of the Invention

[006] The present invention provides a device for communicating a hotel guest's instructions to hotel housekeeping services, and method for such.

[007] The communication device of the subject invention comprises a panel frame, which is mounted onto a wall or other vertical surface. A communication means is positioned on the front side of the communication device, where the guest's instructions are displayed. Additionally, the front side comprises a plurality of instruction displays, which are divided into a number of sections: the instruction section, the choice section, and the indicator section. The instruction section comprises the instructions, for example, "Change Sheets" or Change Towels." The choice section is divided into three choices, either "YES," "NO," or "Neutral." The indicator section is where a guest will communicate instructions by placing an adhesive note in the appropriate location.

[008] For example, if a guest would like to have the bed sheets or towels changed, the guest will slide the indicator to "YES." Conversely, if the guest does not wish to have the sheets or towels changed, the guest will indicate "NO."

[009] A hotel will mount the communication device in a readily accessible and noticeable location, for example in the bathroom, or in the entryway, allowing for use by both the hotel guest and housekeeping services.

[0010] These and other features of the present invention will be more readily understood with reference to the following detailed description, read in conjunction with the accompanying drawing figures.

Detailed Disclosure of the Invention

[0019] The present invention provides a device for communicating a hotel guest's instructions to hotel housekeeping services, and method for such.

[0020] In an embodiment of the present invention, as shown in Figures 1, the communication device 10 of the subject invention comprises a panel frame 12, which can be mounted onto a wall or other vertical surface. The panel frame 12 comprises a front side 14 and a backside 16, where the backside 16 is mounted onto the wall and the front side 14 comprises the communication means 18.

[0021] In an embodiment, the communication means 18 comprises an indented space 20 for the placing of adhesive notes 22. The adhesive notes 22 contain a printed indicator mark thereon, which are used to identify a hotel guest's instructions. If the adhesive notes 22 become depleted, a new note pad can be inserted into the indented space 20. Additionally, the front side 14 comprises a plurality of instruction displays 24. The instruction displays 24 are divided into a plurality of sections. The instruction section 26 comprises the instructions, for example, "Change Sheets" or Change Towels." Adjacent to the instruction section 26 is the indicator window 28, which is divided into two choices, either "YES" or "NO." Adjacent to the indicator window 28 is the indicator section 30. A guest will communicate instructions by placing an adhesive note 22 in the appropriate location in the indicator section 30.

[0022] For example, if a guest would like to have the bed sheets changed, the guest will peel off an adhesive note 22 and place it in the indicator section 30 next to the “YES.” Conversely, if the guest does not wish to have the sheets changed, the guest will place the adhesive note 22 in the indicator section 30 next to the “NO.”

[0023] In an alternative embodiment, the front panel 14 further comprises a message display 32, in which the hotel can leave printed messages to the guests. The message display 32 comprises a flat dry-erase surface, upon which messages can be written and easily erased. Alternatively, the message display 32 contains a note pad, where a message is written on the top sheet of the note pad, and then discarded once read, or a card insert, for the insertion of preprinted messages.

[0024] In a further embodiment, the front panel comprises a room type display 50. The room type display 50 can identify the room as either a “SMOKING ROOM” or a “NON-SMOKING ROOM” or other suitable message.

[0025] In an alternative embodiment, as shown in Figures 2-5, the communication means comprises at least one slot positioned adjacent to a corresponding indicator window, which is positioned adjacent to an instructional section. An indicator is slideably affixed into the slot. The indicator is connected to a display, such that when the indicator is positioned to a first side of the slot, a “YES” is displayed in the indicator window. Similarly, when the indicator is positioned to the opposite side of the slot a “NO” is displayed in the indicator window.

[0026] In an embodiment, as shown in Figures 2, the front side 14 comprises a horizontal slot 34 positioned above a horizontal indicator window 36, which are positioned adjacent to each instruction section 26. A horizontal indicator 38, as shown in Figure 4, is slideably affixed into the horizontal slot 34. The horizontal indicator 38 is connected to a movable display 40, such that when the horizontal indicator 38 is positioned to a first side of the horizontal slot 34, a “YES” is displayed in the horizontal indicator window 36. Similarly, when the horizontal indicator 38 is positioned to the opposite side of the horizontal slot 34, a “NO” is displayed in the horizontal indicator window 36.

[0027] In an embodiment, when the horizontal indicator 38 is centrally positioned within the slot 34, the horizontal indicator window 36 is empty, in a neutral position.

[0028] For example, if a guest would like to have the bed sheets or towels changed, the guest will slide the horizontal indicator 38 to the first side, displaying a “YES” in the horizontal

indicator window 36. Conversely, if the guest does not wish to have the sheets or towels changed, the guest will slide the horizontal indicator 38 to the opposite side, displaying a “NO” in the horizontal indicator window 36.

[0029] In an alternative embodiment, as shown in Figures 3, the front side 14 comprises a vertical slot 42 positioned adjacent to a vertical indicator window 44, which are positioned adjacent to each instructional section 26. A vertical indicator 46, as shown in Figure 5, is slideably affixed into the vertical slot 42. The vertical indicator 46 is connected to a display 48, such that when the vertical indicator 46 is positioned to a first vertical side of the vertical slot 42, a “YES” is displayed in the vertical indicator window 44. Similarly, when the vertical indicator 46 is positioned to the opposite vertical side of the vertical slot 42 a “NO” is displayed in the vertical indicator window 44.

[0030] In an embodiment, when the vertical indicator 46 is centrally positioned within the vertical slot 42, the vertical indicator window 44 is empty, in a neutral position.

[0031] For example, if a guest would like to have the bed sheets or towels changed, the guest will slide the vertical indicator 46 to the first vertical side, displaying a “YES” in the vertical indicator window 44. Conversely, if the guest does not wish to have the sheets or towels changed, the guest will slide the vertical indicator 46 to the opposite vertical side, displaying a “NO” in the vertical indicator window 44.

[0032] In an alternative embodiment, as shown in Figure 7, the terms “YES” and “NO” are displayed in the indicator window. A slot 80 is positioned adjacent to an indicator window 82, which is positioned adjacent to the instructional section 84. An indicator 86 is slideably affixed into the slot 80. A guest indicates the instruction by sliding the indicator 86 to a first position, adjacent to the “YES” or a second position adjacent to the “NO” in the indicator window 82.

[0033] For example, if a guest would like to have the bed sheets or towels changed, the guest will slide the indicator 86 to the first position, adjacent to the “YES” in the indicator window 82. Conversely, if the guest does not wish to have the sheets or towels changed, the guest will slide the indicator 86 to the second position, adjacent to the “NO” in the vertical indicator window 44.

[0034] In an alternative embodiment, the indicator comprises a rotateable disc, with a knob, positioned adjacent to a vertical indicator window, which is positioned adjacent to the instructional section. The rotateable disc is rotateably mounted in the front face 14, where the

[0039] If a guest wishes to have the room cleaned, the guest will indicate the room availability time with the availability display 60. The availability display 60 comprises a rotateable disc 62, a knob 66, and an availability indicator 68. The rotateable disc 62 is rotateably mounted onto the

[0040] A hotel will mount the communication device of the subject invention, in a readily accessible and noticeable location, for example in the bathroom, in the entryway, on the door, or the like.

Figure 1 consists of 12 bar charts arranged in a 3x4 grid. Each chart displays the percentage of respondents for a specific category across six age groups: 18-24, 25-34, 35-44, 45-54, 55-64, and 65+. The categories are: 1. Total respondents, 2. Male respondents, 3. Female respondents, 4. White respondents, 5. Black respondents, 6. Hispanic respondents, 7. Asian respondents, 8. Other respondents, 9. Married respondents, 10. Single respondents, 11. Divorced respondents, and 12. Widowed respondents. The charts show varying distributions across age groups. For example, the 'Total respondents' chart shows a relatively stable percentage across all age groups, while the 'Married respondents' chart shows a significant increase in the 55-64 age group.
